ABSTRACTED-PUB-NO: DE 2941691A

BASIC-ABSTRACT: Solar energy is utilised by converting it  
through  
photosynthesis into organic plant matter. The prim. yield  
of the plant  
substance is partly used as food for man and cattle and  
partly mixed with the  
sec. yield in the shape of human and animal excreta. The  
mixt. is converted to  
methane or ethyl alcohol by an anaerobic fermentation of  
the mesophilic or  
thermophilic type. The digested sludge produced is dried,  
granulated and  
applied as nitrogenous fertiliser to the fields to close  
the biological cycle.

This saves other types of not reclaimable energy (coal,  
oil) and replaces them  
by inexhaustible supplies of solar energy.
